# Carbon Nanoparticles, Nanotubes and Fullerenes

## Carbon Nanotubes, multiwalled

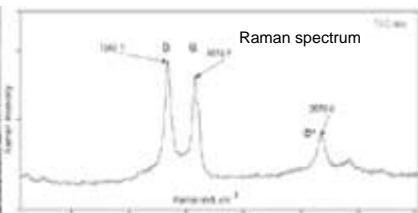

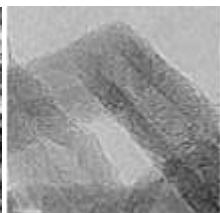

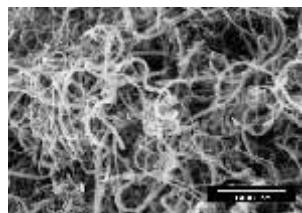

Carbon purity: min. 95 %

Number of walls: 3-15

Outer diameter: 5-20 nm; Inner diameter: 2-6 nm; Length: 1-10 µm

Apparent density: 0.15-0.35 g/cm<sup>3</sup>

Loose agglomerate size: 0.1-3 mm

## NanoDiamonds

All types of nanodiamonds and nanographite / nanodiamonds mixtures are produced by controlled dry detonation synthesis followed by purification procedures.  
We are ready to change product quality in case of special requirements.

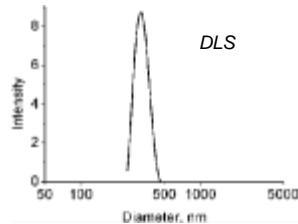

## Graphite / Diamond Nano-Mixture, the most native, raw, just after detonation synthesis

Average diamond primary particle size: 4 nm

Diamond content: min. 20%

Ash content: < 6%

RN-PL-GD-5g	5 g
RN-PL-GD-25g	25 g
RN-PL-GD-100g	100 g

## Oxide NanoCeramics

Along with the listed NanoCeramics many other ceramics were produced as trial batches, e.g. NanoCeramics from Rare Earth Oxides, HfO<sub>2</sub>, MgO+C, TiO<sub>2</sub>, TiC, TiN, BN, YO<sub>3</sub>, Basic technology permits to produce nearly any ceramic in nanosized form, thus we are expecting here the concrete wishes from our customers.

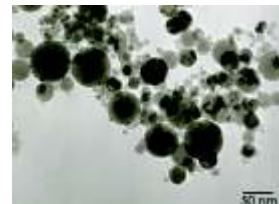

### Aluminium oxide

Al<sub>2</sub>O<sub>3</sub> Nanopowder, (alpha) Particle shape: spherical

Average particle size: ca. 40 nm; Particle size full range: 5 - 150 nm

RN-PL-InO-50g	50 g
RN-PL-InO-100g	100 g

## **Iron (II,III) oxide**

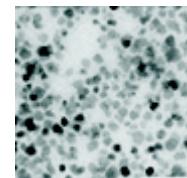

Fe<sub>3</sub>O<sub>4</sub> Nanoparticles aqueous suspension, magnetic fluid

ca. 300 Gauss, aqueous suspension

Contains ca. 3% of stabilizer (oleic acid)

Average particle size: 8 nm

Concentration: ca. 7 wt.%

RN-PL-M-Fe3O4-10m	10 mL
-------------------	-------

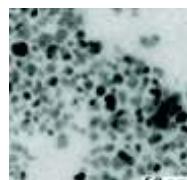

Fe<sub>3</sub>O<sub>4</sub> Nanoparticles aqueous suspension, magnetic fluid

Without organic stabilizers

Excellent for L-b-L, LB coatings and for experiments

where absence of organic stabilizer is desirable.

Average particle size: 8±3 nm. Concentration: ca. 3%

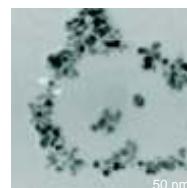

## **Iron (III) oxide**

Fe<sub>2</sub>O<sub>3</sub> Nanoparticles aqueous suspension

Produced by chemical synthesis

Average particle size: 4-8 nm

Supplied as 5% aqueous suspension

RN-PL-FeO-10g	200 mL
RN-PL-FeO-50g	1000 mL

## **Magnesium Oxide**

MgO - Nanopowder

Primary particle average size: ca.20 nm; Specific surface: ca. 50 m<sup>2</sup>/g

Purity: > 99%

RN-PL-MgO-25g	25 g
---------------	------

## **Silicon dioxide**

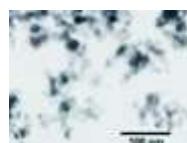

SiO<sub>2</sub>- Fumed silica, nanopowder, hydrophilic

Primary particle average size: 7-14 nm

Specific surface: > 200 m<sup>2</sup>/g

Bulk Density: ca. 0.048 g/cm<sup>3</sup>

Purity: > 99.8% (excl. ca. 2% moisture)

RN-PL-SiOF-25g	25 g
----------------	------

### **SiO<sub>2</sub>- Fumed silica, nanopowder, hydrophobic**

Primary particle average size: ca. 14 nm

Specific surface: ca. 100 m<sup>2</sup>/g

Bulk Density: ca. 0.05 g/cm<sup>3</sup> Purity: > 99.8% (excl. stabilizer)

Modified by polydimethylsiloxane (PDMS)

RN-PL-SiOF-PDMS-25g	25 g
---------------------	------

### **SiO<sub>2</sub>- Fumed silica, nanopowder, hydrophobic**

Primary particle average size: 7-14 nm

Specific surface: ca. 150 m<sup>2</sup>/g

Bulk Density: ca. 0.05 g/cm<sup>3</sup> Purity: > 99.8% (excl. stabilizer)

Modified by octylsilane

RN-PL-SiOF-OS-25g	25 g
-------------------	------

### **SiO<sub>2</sub>- Nanoparticles, 10 nm, 30% aqueous suspension**

Primary particle average size: ca. 10 nm

Specific surface: ca. 320 m<sup>2</sup>/g

Density: ca. 1.2 g/cm<sup>3</sup>

Purity of solid component: > 99.5%

Admixtures: Na ca. 0.45%

RN-PL-SiO10-30p-100m	100 mL
----------------------	--------

### **SiO<sub>2</sub>- Nanoparticles, 20 nm, 50% aqueous suspension**

Primary particle average size: ca. 20 nm

Specific surface: ca. 140 m<sup>2</sup>/g

Density: ca. 1.4 g/cm<sup>3</sup>

Purity of solid component: > 99.5%

Admixtures: Na ca. 0.25%

RN-PL-SiO20-50p-100m	100 mL

## **Strontium oxide**

### **SrO - Nanopowder**

*Produced by chemical synthesis*

Average particle size: 200±50 nm

RN-PL-SrO-1g	1 g
RN-PL-SrO-10g	10 g

## **Tin oxide**

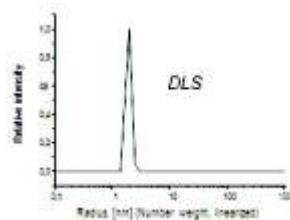

### **SnO<sub>2</sub>- Nanoparticles suspension, 5%**

Produced by chemical synthesis

Average particles size 4-8 nm

Purity of dry component: min. 99.5%

RN-PL-SnO-10g	200 mL
RN-PL-SnO-50g	1000 mL

## Titanium oxide

TiO<sub>2</sub>- Nanoparticles, dry powder anatase phase

Produced by chemical synthesis

Average particle size: 4-8 nm

Dry nanopowder, free of organic stabilizers.

Easily forms colloidal solutions in water.

Can be used to produce coatings.

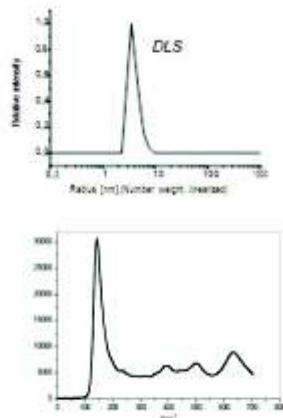

RN-PL-TiO-NO-10g	10 g
RN-PL-TiO-NO-50g	50 g

TiO<sub>2</sub>- Nanoparticles aqueous suspension, anatase phase

Produced by chemical synthesis

Average particle size: 6±2 nm.

Aqueous colloidal solutions: 5, 10 or 20 wt.%

Aqueous colloidal solution, 10 wt.%

RN-PL-TiO-5p-10g	200 mL
RN-PL-TiO-5p-50g	1000 mL

Aqueous colloidal solution, 20 wt.%

RN-PL-TiO-20p-10g	50 mL
RN-PL-TiO-20p-50g	250 mL

TiO<sub>2</sub>- Nanoparticles, type P25

Photocatalytic standard P25

Dry Nanopowder. Mixed rutile / anatase phase

Average primary particle size: 21±5 nm.

Specific surface: 50±10 m<sup>2</sup>/g; Purity after ignition: >99.5%

Ignition loss: < 2%; Moisture: < 1.5%

Al<sub>2</sub>O<sub>3</sub> < 0.3 wt.%; SiO<sub>2</sub> < 0.2 wt.% Tapped density: ca. 130 g/L

RN-PL-TiO-P25-10g	10 g
RN-PL-TiO-P25-50g	50 g

## TiO<sub>2</sub>- Nanoparticles, type P25, hydrophobized

Photocatalytic standard P25, Dry Nanopowder.

Mixed rutile / anatase phase

Average primary particle size: 21±5 nm.

Specific surface: 50±10 m<sup>2</sup>/g

Purity after ignition: >99,5%

Ignition loss: < 2%; Moisture: < 1,5%

Al<sub>2</sub>O<sub>3</sub> < 0,3 wt.%; SiO<sub>2</sub> < 0,2 wt.%

RN-PL-TiO-P25-HPB-10g	10 g
RN-PL-TiO-P25-HPB-50g	50 g

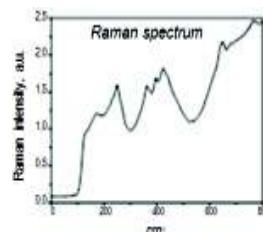

## TiO<sub>2</sub>- Nanoparticles aqueous suspension, brookite/anatase

Average particle size: 2-5 nm.

Mixed brookite / anatase phase.

Stabilized by tetramethylammonium hydroxide

Aqueous colloidal solution, 20 wt.%

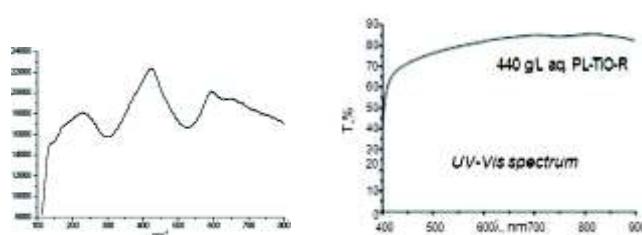

RN-PL-TiO-N-20p-15g	75 mL
RN-PL-TiO-N-20p-50g	250 mL

## TiO<sub>2</sub>- Nanoparticles, rutile

Average particle size: 2±1 nm. Dry nanopowder.

Readily forms colloidal solutions in water (up to 900g/L) and methanol

RN-PL-TiO-R-5g	5 g
RN-PL-TiO-R-25g	25 g

## TiO<sub>2</sub>- Nanoparticles, anatase, hydrophobic, 25% & 40%

Average Particle Size: 4-8nm, Anatase phase, Highly transparent.

Stabilized by 2-[2-(2-Methoxyethoxy)ethoxy]acetic acid

Forms transparent colloidal solutions in mixture of: 80% PGMEA : 20%PGME  
(PGMEA: Propylene glycol methyletheracetate; PGME=Propylene glycol methyl ether), Supplied as a 250g/L & 400g/L solution in PGMEA/PGME

RN-PL-TiO-PGMEA-25p-10m	10ml	RN-PL-TiO-PGMEA-40p-10m	10ml

## **TiO<sub>2</sub>- Nanoparticles, anatase, hydrophobic**

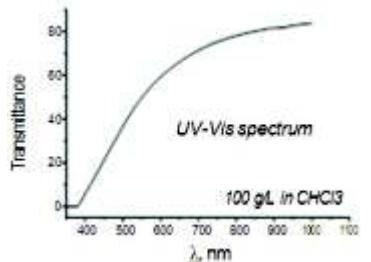

Average particle size: 4-8 nm. Anatase phase.

Stabilized by dodecylphosphonic acid and hexylamine.

**Forms transparent colloidal solutions in chloroform.**

Supplied as a powder

RN-PL-TiO-HPBC-1g	1 g
RN-PL-TiO-HPBC-10g	10 g

## **TiO<sub>2</sub>- Nanoparticles, anatase, hydrophobic**

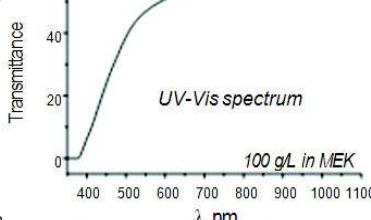

Average particle size: 4-8 nm. Anatase phase.

Stabilized by benzoic acid

**Forms transparent colloidal solutions in MEK (methyl ethyl ketone) and many epoxides.**

Supplied as a 100 g/L solution in MEK.

RN-PL-TiO-HPBM-10p-1g	10 mL
RN-PL-TiO-HPBM-10p-10g	100 mL

## **TiO<sub>2</sub>- Nanorods, 1% aqueous solution**

Length: ca. 100 nm.

Diameter: 20-40 nm

Stabilized only with citrate.

Phase: anatase

Supplied as a 1 wt.% aqueous solution

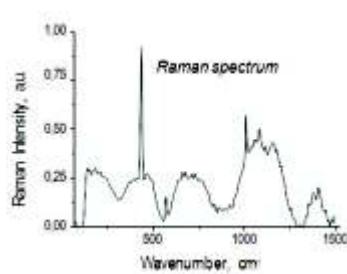

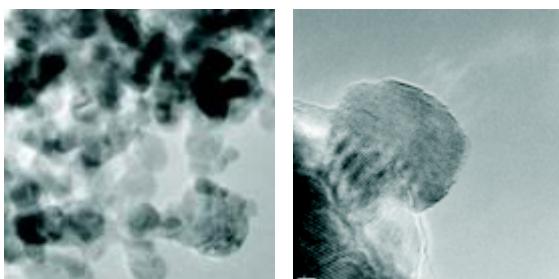

RN-PL-TiONR-10m	10 mL
RN-PL-TiONR-100m	100 mL

## **Zinc oxide**

### **ZnO - Nanopowder, ca. 14 nm**

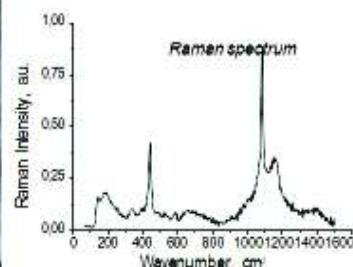

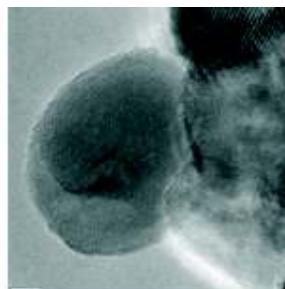

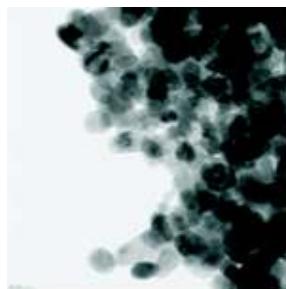

Average particle size: ca. 14 nm; Specific surface area: 30±5 m<sup>2</sup>/g Purity: > 99%

RN-PL-ZnO14-5g	5 g
RN-PL-ZnO14-25g	25 g
RN-PL-ZnO14-100g	100 g

## ZnO - Nanopowder, ca. 25 nm

Average particle size: ca. 25 nm; Specific surface area:  $19 \pm 5 \text{ m}^2/\text{g}$  Purity: > 99%

## Zirconium oxide

### ZrO<sub>2</sub>- Nanopowder, tetragonal

Stabilized with 3 mol% Y<sub>2</sub>O<sub>3</sub>

Average particle size: 10-30 nm; Specific surface area:  $45 \pm 10 \text{ m}^2/\text{g}$

Purity: > 92.7%

Controlled admixtures, %: YO  $\leq$  5.2; Al<sub>2</sub>O<sub>3</sub>  $<$  0.07; SiO<sub>2</sub>  $<$  0.09; HfO<sub>2</sub>  $<$  1.87

### ZrO<sub>2</sub>- Nanopowder, cubic

Stabilized with 6 mol% Y<sub>2</sub>O<sub>3</sub>

Average particle size: 20-50 nm; Shape: spherical.

Particles are bound by necks forming aggregates.

Cubic structure is due to the stabilizer and to the small particle size (size effect).

## Quantum Dots

Luminescent inorganic nanocrystals (Q-dots). The emission wavelength is a function of the crystal size - crystals of the same chemistry can have the emission maxima in a wide range.

CdTe hydrophilic Q-dots are coated with -COOH groups and can be easily used for labeling purposes for chemical and biological applications.

CdSe/ZnS and ZnCdSe/ZnS (core/shell type) Q-dots are hydrophobic and are soluble in most non-polar organic solvents.

### CdTe Quantum Dots, powder, hydrophilic

Easily forms colloidal solutions in water. Terminated with -COOH group.

Ideal for labeling purposes. Coupling with -NH<sub>2</sub> groups can be achieved through EDC-mediated esterification.

#### General labeling procedure for proteins

(adopted from Wang et al. *Nanoletters* 2002, vol. 2, No. 8, 817-822):

Reaction mixture containing 0.1  $\mu\text{M}/\text{mL}$  CdTe quantum dots, 2 mg/ $\text{mL}$  protein, 1 mg/ $\text{mL}$  sulfo-NHS (CAS# 106627-54-7), 10 mg/ml EDC (CAS# 25952-53-8) in pH 7.0 PBS buffer is prepared and stored for 2-4 h at room temperature and then stored at 4°C overnight.

The precipitate (unconjugated Q-dots) if any is removed by centrifugation. The stock of ready-to-use product should be stored at 4°C. Optionally it can be dialyzed on a membrane with MWCO of 12000-14000 against pH 7.0 PBS buffer and stored at 4°C.

Emission wavelength may slightly shift after labeling procedure.

## Tectomers

Tectomers are a novel type of self-assembling molecules. The structure of a tectomer represents several oligoglycine units linked to one common center. The pH dependent formation of strong hydrogen bonds between molecules leads to their selfassembly into extra-regular 2-D or 3-D layers of monomolecular thickness. 10 mg of any tectomer is enough for coating of more than 2 m of surface.

## PEG Derivatives

PEG oligomers are processed into a variety of derivatives. A high purity for intermediates and products is maintained, and our catalogue items have an overall purity exceeding 95%. In comparison to PEG products obtained from polydisperse material, the use of our compounds is therefore more consistent.

## Phosphonic Acids Derivatives

Alkylphosphonic acids are widely used for production of nanoparticles such as quantum dots, nano-metals, nano-ceramics. By varying the carbohydral chain length one can change the particles' shape and size. Besides, they can be used for coating of many materials (including nanoparticles) by condensed hydrophobic monolayers.

## Graphenes on transparent mica and other substrates

Graphene is an allotrope of carbon, whose structure is a one-atom-thick planar sheet of sp<sup>2</sup>-bonded carbon atoms that are densely packed in a honeycomb crystal lattice. The C-C bond length in graphene is about 0.142 nm. Graphene differs from most conventional three-dimensional materials. Intrinsic graphene is a semi-metal or zero-gap semiconductor. Experimental results from transport measurements show that graphene has a remarkably high electron mobility at room temperature, with reported values in excess of 15,000 cmV<sup>-1</sup>s<sup>-1</sup>. Graphene's unique electronic properties lead to an unexpectedly high opacity for an atomic monolayer; it absorbs 2.3% of white light (where  $\alpha$  is the fine-structure constant).

Graphenes on atomically flat substrates (e.g. on mica) can be accurately characterized and employed for various promising experiments.

Reinste Nano Ventures offers graphenes on different substrates like mica (which is a default material), silicon, glass, quartz etc. We can also place a graphene sheet onto a precoated substrate. The form, size and shape of the substrate can be easily adopted to fit your needs. A standard sample represents a mica disk of ca. 1 cm in diameter with mono-, bi- and fewlayer graphene(s) in the range from 20 µm<sup>2</sup> to several thousand µm<sup>2</sup> on its surface; the disk is mounted in a plastic holder. The sample is optically transparent and can be observed both in reflected and transmitted light. Each sample is accompanied with a set of images which will help to easily locate the graphene sheet on a substrate.

## Industrial and Consumer Products on the Base of Nanomaterials

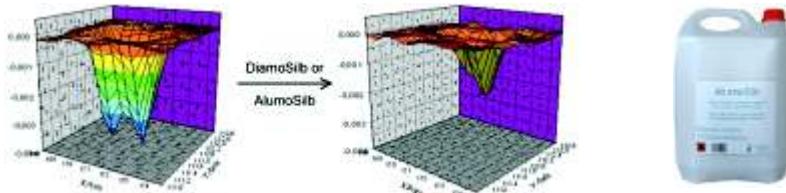

### Additives for electroplating and electroless plating baths

DiamoSilb®, AlumoSilb®, DiamoChrom™, DiamoHard-N™, DiamoGold™

New word in metal plating. Friction and wear of galvanic metal coatings can be significantly reduced by using of our nanoparticles-based electrolyte additives.

Contact us for directions for use.

Considerable reduction of Wear and Friction coefficient by 50%

RN-PL-DiAg-1L	DiamoSilb, additive for silver plating, 1 L

RN-PL-DiCr-1L	DiamoChrom, additive for chromium plating 1 L
RN-PL-DiAu-1L	DiamoGold, additive for gold plating, 1 L
RN-PL-DiHard-1L	DiamoHard-N, additive for nickel plating, 1 L

### Additives for motor oils

ADDO®: novel additive for engine oils:

ADDO is based on a mixture of Diamonds and Graphite nanoparticles. Very fine particles of NanoDiamond, with size of only 6 nm polish the moving parts of an engine to mirror quality, leaving no defects and reducing friction and wear.

NanoGraphite is working as a natural and an extremely efficient dry lubricant reducing the friction further (see also [www.addo-oil.com](http://www.addo-oil.com))

Your engine becomes more efficient, it uses less fuel and lives longer.

### DIAMOPOL: Super-Finish Polishing Paste

The current state-of-the-art technologies of super-finish polishing allow to achieve the roughness of ca. 2 nm. The use of our polishers based on nanoparticles allows to reduce the roughness by a factor of 2 and reach the value of 0.9 nm. These polishers can be supplied in hydrophilic, hydrophobic and all-purpose forms.

# Nano Silver based Industrial Use Products

Reinst Nano Ventures Pvt. Ltd. provides you Liquid Nano Silver technology and unique Nano Silver intermediaries which converts all kind of Detergents, Ceramics, Plastics and Textiles into effective Antimicrobial , Antibacterial, Anti Viral and Anti Fungal properties enhanced products.

## 1. Liquid Nano Silver: Aqueous dispersion of colloidal silver

Potential applications of Liquid Nano Silver products range from varnishes and coatings over thermoplastic, thermosetting and elastomeric polymers to textile fibers. Liquid Nano Silver is therefore utilized as an antimicrobial additive for many chemical formulations like detergents, dyes, cleaners and cosmetics.

This Liquid Nano Silver is having the particle size of 15 nm and is totally miscible in water. It can be used as an additive to any water based coatings.

Liquid silver which is available in W10 ( i.e. 100,000 ppm nano silver solution in water), W25 ( i.e. 250,000 ppm nano silver solution in water) or W50 ( i.e. 500,000 ppm nano silver solution in water).

## 2. Nano Silver Master Batches

### • Nano Silver PP-Master Batch

Nano silver master batch is developed for antimicrobial equipment of Thermoplastics, specially for the equipment of fibres which are produced by melting, mono as well as multifilament fibres. It is Lightest of all Chemical Fibres, used in carpets, artificial turfs and ropes.

**Chemical Character:** PP resin in form of pellets containing Nano Silver.

**Silver Content-** 5000 ppm

**Approx Particle Size** of Silver < 30 nm

**Standard Packages-** Air tight bags with a content of 25 kg

### • Nano Silver PET Master Batch

Nano silver master batch is developed for antimicrobial equipment of Thermoplastics, in special for the equipment of fibres which are produced by melting, mono as well as multifilament fibres. Bacteria prefer to keep in a moist environment in which they can reproduce the best. This environment can be found frequently in the bathroom, kitchen or bedroom and these nano silver products will help to clean them.

Ideal application areas for your antibacterial tissues are therefore:

- ◆ Linen. Mattress Covers
- ◆ Washing and dish towels. Towels and washcloths
- ◆ Knitted wear, functional wear
- ◆ Workwear

**Chemical Character-** PP resin with Nano Silver

**Silver Content-** 10,000 ppm

**Approx Particle Size** of Silver < 30 nm

**Standard Packages-** Air tight bags with a content of 25 kg

- ◆ **Nano Silver Polyamide 6 (PA 6) Master Batch**

Antimicrobial finishing of staple fibres from polyamide 6 by melt spinning. Nylon (PA 6), Perlon (PA 6): The character of many PA-fibres makes them predestinated for the fabrication of clothing. They are easily dyed, lighter than silk, elastic, mothproof, stable against rotting and alkali substances and they are as well crease-resistant and tear proof. Nylon stockings are the prime example for the usage of polyamide. Natural polyamides are peptides and proteins like hair, wool and silk.

Chemical Character/Composition: Polyamide 6 pellets containing Nano Silver

- ◆ **Nano Silver Polyethylene PE Master Batch**

Polyethylene is probably the most produced plastic material. Plastic bags, buckets, plastic films, baskets, and many other items are typically made of PE.

Material	Minimum order amount	Description
Si MB PA/ 6.5	25 kg	PA Nano-Silver master batch, content 6.500 ppm = 0.65 %

### 3. Nano Silver Yarn

These are Nano Silver embedded Fibre yarn which can be mixed with normal yarns for making Antimicrobial textiles.

Material	Minimum order amount	Description
Si PET fil. fiber 200	1 ton	PET multi filament fibers, various Dtex e.g 80D/100F, (POY, DTY, FOY)
Si PET/PA fil. Fiber 200	1 ton	PET/PA compound 70/30 multi filament fibers, various Dtex, 200 ppm for fabrics and knitware
Si PET/COT Yarn 200	1 ton	PET/COT blended Yarn Nm 50/2 (=200(2)Dtex), 200 ppm for fabrics and knitware

At Reinst Nano Ventures we ardently believe that innovation and differentiation are the fundamental components of growth and enlightenment of any organization. With a portfolio of products catering to the needs of almost all scientific research communities in nanotechnology sphere, we help our customers by delivering the most pertinent nanomaterials with the assurance of quality. We rejoice in the fact that our products and services add values to our customers and in progression we build a priceless relationship of eminence with precision.

## Novel Technology

The main technology points concern the development of processes induced by low-temperature plasma on different surfaces and in organized mono-molecular films (Langmuir-Blodgett and Self-Assembly Films), in atomically flat inorganic solids and in liquid interfaces and advanced technologies of synthesis and modification of nano-materials.

Chemical and low temperature plasma modification of nanopowders are performed with the purpose of functionalization of nano-particle's surface assisted by new plasma-chemical methods developed for ultra-dispersed materials. This approach leads to a new family of industrial nano-products with improved and tailor-made properties.

### Two technologies for industrial production of NanoDiamonds, NanoCeramics and NanoMetals

#### Controlled Detonation Synthesis (CDS)

Controlled Detonation Synthesis is based on super-high pressure developed at explosion in closed volume. At explosion precursor material, immersed in specific gas medium, is atomized. During the fly from the middle of reactor to the reactor walls atoms are clusterized and form nanoparticles. During whole synthesis process the super-high pressure is supported which enable formation not only of different NanoCeramics with unusual crystalline lattice, but also of cubic carbon nanoparticles (NanoDiamonds).

Having in disposal big industrial detonation reactors PlasmaChem is able to deliver tons of detonation nanoproducts per month.

#### Hot Plasma Jet Synthesis (HPJS)

Hot plasma process know-how is used to produce nanoparticles.

Precursor material is atomized in plasma arc with followed clusterization to nanoparticles optionally with additional plasma chemical conversion to another material than precursor. The special precautions are done to get real nanocrystals (not simply mixed phases) and to exclude big agglomerate formation.
